# Siddur Guide

*Learn Jewish prayers with audio, transliteration, and translation*

**Arslan Nuriev**

ar.nuriev@innopolis.university

SE Toolkit — Hackathon Lab 9

# Context

### END-USER

Russian-speaking beginners and those interested in Judaism who want to learn how to correctly read and pronounce Hebrew prayers.

### PROBLEM

Hebrew pronunciation is hard for beginners, and there is no simple self-study tool that pairs the original text with Cyrillic transliteration, spoken audio, and the actual prayer times for where the user lives.

### PRODUCT IDEA

> *"An audio guide for learning Jewish prayers — Hebrew text, Cyrillic transliteration, Russian translation, pronunciation audio, and daily prayer times."*

# Implementation

## Version 1 — Core

- Catalog of 7 core prayers in 3 categories
- Hebrew text + Cyrillic transliteration + Russian translation
- Audio pronunciation (Hebrew neural TTS)
- Category filter, clean mobile-first UI
- FastAPI + PostgreSQL + React, all dockerized

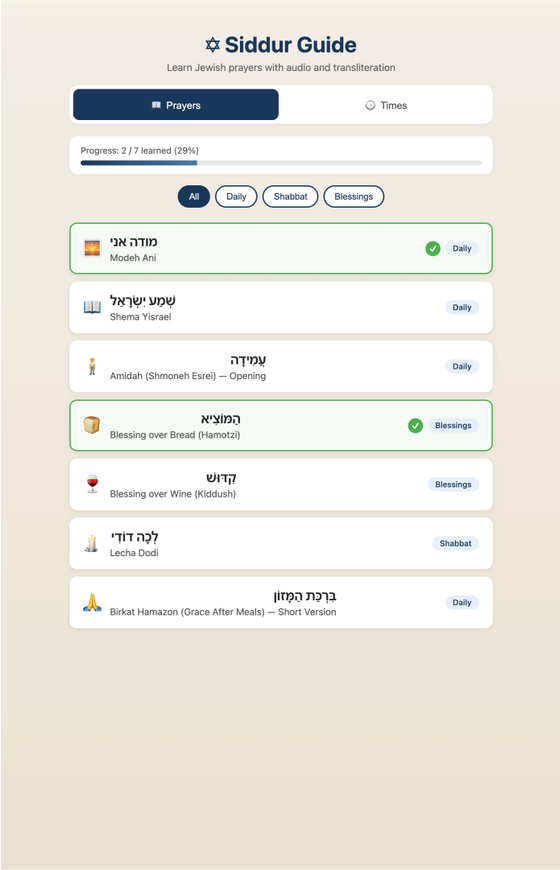
*Stack: FastAPI · PostgreSQL 16 · React 18 · nginx · Docker Compose*

## Version 2 — Polish + Deploy

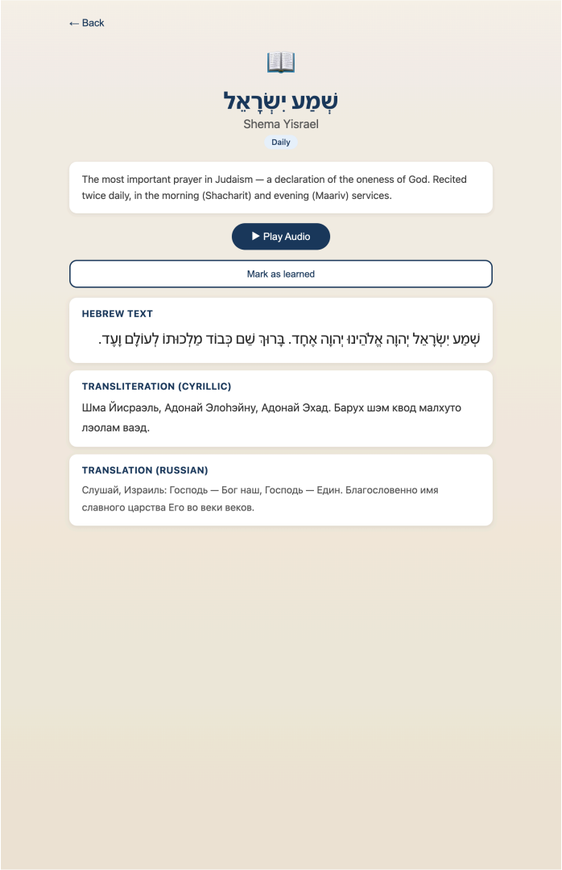
- Daily prayer times (Shacharit, Mincha, Maariv, sunrise, sunset) for 10 cities incl. Innopolis
- Zmanim computed locally via KosherJava algorithm — fully offline
- User progress tracking with persistent "learned" state
- Prayer icons, progress bar, tabbed navigation
- Deployed to Innopolis University VM

*TA feedback addressed: no specific feedback was given after V1; V2 followed the originally planned roadmap in full.*

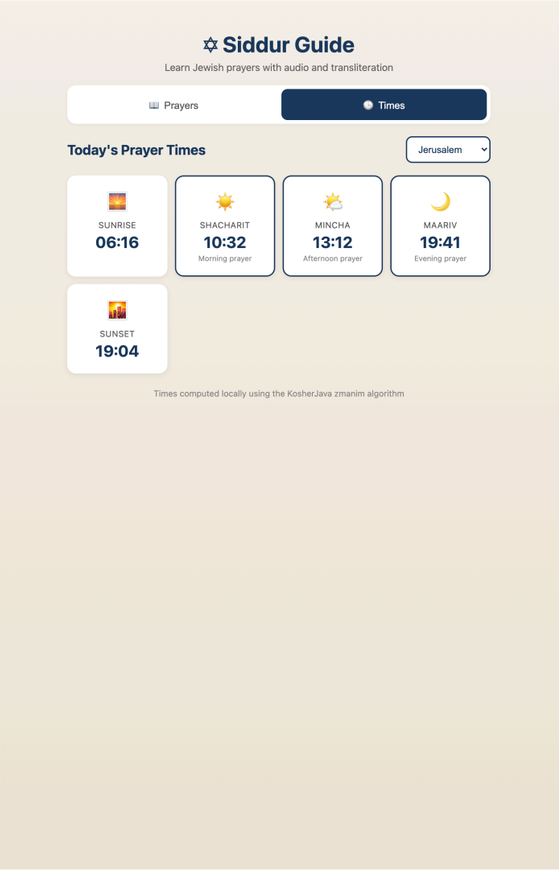
# Demo



Catalog with progress bar & categories



Hebrew, transliteration, translation & audio



Daily prayer times by city
